

CLAUDE / GITHUB / VERCEL / DOMAIN

CLAUDE websites in 4 STEPS

How I build websites with Claude, step by step. The simple version, so you can go from an idea to a real website on your own domain.

4 STEPS

NO CODE NEEDED

THE MAP

before you start

01**BUILD**

Claude builds the site in a folder on your computer

02**PUSH**

Send the code to GitHub

03**DEPLOY**

Vercel puts it live on the internet

04**DOMAIN**

Connect your own name from GoDaddy

WHAT YOU NEED

The Claude desktop app, a GitHub account, a Vercel account, and a domain if you want one. That's it.

WHAT IT COSTS

Only the Claude subscription (\$20/month) and your domain. Skip the domain and the free Vercel link works fine.

The rule for the whole guide: any time you get stuck, copy and paste what you see (or screenshot it) and give it to Claude. Have it walk you through it and make it simple.

01 BUILD IT with claude

Open the Claude desktop app and give it a folder to build in. Then talk to it like you'd talk to a developer you hired. This is close to what I actually send:

COPY THIS

Yo! Got a new project for you. I need to build a website that **[does what]**. I want it to look like **[site you like]** and **[another site you like]**, and here is what I really care about: **[your must-haves]**.

Make it well, review what you built, test everything, then give me a copy and paste command to paste into terminal to view it on a local server so I can review it before deploying.

HOW YOU KNOW IT'S DONE

- 01 It looks the way you want.
 - 02 It does every task you want, and does it well.
 - 03 No glitches and no bugs. Click everything before you move on.
-

DON'T LET IT look generic

The #1 mistake is a site that looks like every other AI site. Claude will use its same default look unless you give it more to work with.

SHOW EXAMPLES

Give Claude a few websites you really like. Tell it what you like about each one.

PREMIUM COMPONENTS

Use a site like 21st.dev to grab premium components and hand them to Claude.

REAL MEDIA

Grab high quality photos and videos. Cheap images make a good site look cheap.

FONTS + BUTTONS

Tell it to use a professional font and buttons that aren't the generic ones it always uses.

Be informative. Give Claude lots of help, and the more it knows, the better it builds. If you have a question, ask Claude. Be a problem solver.

02 **PUSH IT** to github

GitHub holds your site's code. You don't need any other app for this. Claude gives you terminal commands that do everything for you.

- 01** Set up a GitHub account in your browser. It's not too complex.
- 02** Create a new repo for your project.
- 03** Screenshot the repo page with the code on it and give it to Claude.
- 04** Ask for the terminal commands, then copy and paste them into your terminal.
- 05** Copy and paste whatever the terminal says back to Claude so it can walk you through it.

COPY THIS

Here's a screenshot of my new GitHub repo. Give me the terminal commands to push my site to this repo, and keep it simple.

03 DEPLOY on vercel

Vercel takes your code from GitHub and puts it live on the internet with a free link.

- 01 Create a Vercel account.
- 02 Click **New Project**.
- 03 Click **Connect GitHub** and connect your account. This makes everything easy.
- 04 Import your repo.
- 05 Click **Deploy**. Your site is live.

MAKING CHANGES LATER

When you change something and push it to GitHub, Vercel deploys it automatically. Nothing changes on your live site until you push, so you can test everything first.

04 **CONNECT** your domain

Optional. The free Vercel link works, but your own name looks pro. Grab a domain on GoDaddy, then:

- 01** In Vercel, go to **Domains** and click **Add Domain**.
- 02** Type in your domain name. Vercel gives you a value.
- 03** Put that value into GoDaddy.
- 04** Delete the other records in GoDaddy that still point to the generic site.

COPY THIS

Here are screenshots of my Vercel domain page and my GoDaddy settings. Walk me through connecting my domain, step by step, and make it simple.

THE CHEAT sheet

01 BUILD

CLAUDE

- ☐ Give Claude a folder, the prompt, and examples of sites you like
 - ☐ Premium components, real photos and videos, pro fonts and buttons
 - ☐ View it on a local server. Looks right, works right, no bugs
-

02 PUSH

GITHUB

- ☐ Make a GitHub account and create a new repo
 - ☐ Screenshot the repo, ask Claude for the terminal commands, paste them in
-

03 DEPLOY

VERCEL

- ☐ New Project, Connect GitHub, import your repo, Deploy
 - ☐ Every push to GitHub updates the live site
-

04 DOMAIN

GODADDY

- ☐ Vercel: Domains, Add Domain, copy the value it gives you
 - ☐ GoDaddy: paste the value, delete the old records
-

STUCK?

ALWAYS

- ☐ Screenshot it or copy and paste it to Claude and ask it to make it simple
-

WANT IT done for you?

This guide is the simple version. If you want to skip the learning curve, there are two ways I can help.

FULLY CUSTOM BUILD

I build your site fully custom to your needs, start to finish, live on your domain.

PRIVATE CALL

Book a private call and I'll answer any of your questions, one on one.
